- In home
- Intervention (*First Steps*)

Principles of Practice

Leland Medical Clinic (LMC) is a health clinic offering area patients a team approach to healthcare.

The team approach means that the entire LMC staff, as well as the patient, work together as a team by focusing on all aspects of the patient's health using enhanced technology and chronic disease management.

We use multiple technologies to enhance delivery of care by allowing our staff to spend more time with the patient and less time on record keeping. The LMC staff can connect electronically to pharmacies and area hospitals community health records and patients have real time access to their medical records via our online portal.

Occupational Therapy

The occupation, or “job,” of childhood is play, through which children learn, explore and participate in their environment and with others every day. Occupational therapists provide three basic areas of support for children: fine motor, cognitive, and / sensory. Occupational Therapist can help children achieve greater independence in daily routines and activities.

Physical Therapy

Children with neurological, orthopedic, or developmental disorders may need the assistance of specialized equipment, customized orthotics, and/or exercises to strengthen and coordinate motor movements needed to safely and efficiently navigate their environment. Physical Therapists help children find their “Gol”.

Speech Therapy

Developing communication skills is one of the most important elements to socializing and creating valuable relationships. For the child with a speech and/or language disorder, communicating can be very difficult, and can cause frustration, isolation, and a sense of helplessness. Speech-Language Pathologists help children overcome communication barriers so that they are empowered to speak for themselves.

Behavioral Health

Children and families may need help coping with stress and a variety of emotional and behavioral issues. Many children and teens need help dealing with stressors such as homework, test anxiety, bullying, traumatic experiences, grief and loss, home life changes, or peer pressure. Sometimes children, like adults, can benefit from therapy.

Psychological Testing

Psychological testing can help children and families identify mental health issues that interfere with aspects of the child’s life. Testing identifies the problem and then referrals are given to help the child and their family seek help with the diagnosis.
